They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammattory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiactasia, correction of congenital heart disease with Fontan's operation, correction of congenital heart disease with Fontan's operation, mucosal diseases estimout ulceration, e.g. Menetrier's disease, collagenous disease, eosinophilic gastroenteritis, and immune diseases, eq. systemic lupus erythematosus or food allergies, primarily to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Zneul can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. It may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul may also be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This claimed polypeptide comprises amino acid residues 105-177 of C the human Zneul mature protein (see M88382), i.e. the 2 epidermal growth factor-like domains (see also W88384-85) of Zneul is a new neuro-growth factor-like protein that can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. Zneul may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul can be used to treat Alzehmer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, cardiovascular disease, cardiovascular disease, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, applastic annæmia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC C74446 to C77606 encode the proteins given in B40237 to B43397, which CC represent the human ORFX open reading frames I to 3161. The ORFX CC sequences have activities such as: cytostatic; hapatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; CC anticonvulsant; antiarthitic; immunosuppressant; immunostimulant; CC cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; CC antiviral; antifungal; antifungal; antifungal; antiinflammatory; antibacterial; CC antiviral; antifungal; antifungal; antifungal; antifungal; antifungal; antitheumatic; antithyroid; and antianaemic. The CC sequences can be used for determining the presence of or predisposition or preventing or treating pathological conditions associated with an CC proteins in gene therapy vectors. The proteins and nucleic acids may be CC disorders, osteoarthritis, graft vs host disease, cardiovascular disease, cc diabetes mellitus, hypertension, hypothyroidism, cholesterol ester CC disorders, systemic lupus crythematosus, severe combined immunodeficiency CC disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and CC cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to cnhance coagulation; to inhibit thrombosis; and as a contraceptive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This claimed polypeptide comprises amino acid residues 1-158 of the 20 human Zneul mature protein (see W88382), i.e. the first HSMRC3WFA concluding domain and first EGF-like domain of Zneul. Zneul. is Zneul. and Euro-growth factor-like protein that can be used as a growth, and intenance, or differentiation factor in the Spinal cord, heart, cord in breast cancer, glioblastoms, and pituitary adenomas. Zneul may also play a cord can be used to treat Alzheimer's disease, cancer, to made in the placenta, in fertility and contraception, or to concluding specific domains of Zneul and epitope-bearing portions of concluding specific domains of Zneul and epitope-bearing portions of concluding specific domains of Zneul and epitope-bearing portions of concluding specific domains of Zneul and epitope-bearing portions of concluding specific domains of Zneul and epitope-bearing portions of concluding specific domains of Zneul and epitope-bearing portions of concluding specific assays.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This claimed polypeptide comprises amino acid residues 105-273 of CC the human Zneul mature protein (see #88382), i.e. the 2 epidermal CC growth factor-like domains (see also #88384), i.e. the 2 epidermal CC growth factor-like domain of Zneul Zneul is a new neuro-growth CC factor-like protein that can be used as a growth, maintenance, or CC differentiation factor in the spinal cord, heart, spleen, testis, CC thyroid and lymph nodes. Zneul may also play a role in breast CC cancer, gliobiastomas, and pituitary adenomas. Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, CC fertility and contraception, or to regenerate nerves. Claimed CC Zneul polypeptides (see also #88382-97), including specific domains CC facul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in diagnostic assays.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC This invention describes novel cDNA sequences (A) highly expressed in CC normal uterine tissue which can have anticancer and cytostatic activity CC and can be used for gene therapy. (A) are used (i) for recombinant CC expression of polypeptides (B) and (ii) to isolate complete genes. CC (B) are used (i) to identify agents suitable for treatment of uterine CC cancer; (ii) directly for treating this form of cancer (including CC expression from gene therapy vectors) and (iii) for generation of CC sequence tags) from a particular tissue type before comparison of CC expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated CC with the fact that ESTs from different libraries may represent CC differency of occurrence in a particular tissue. Y59889 Y59982 represent CC protein fragments encoded by the human uterine tissue derived cDNA cover the content parts of the same unknown gene, distorting the estimated CC fragments represented in 241325-241385.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
Y52138-Y52140 are amino acid sequences of spliced variants of TANGO 125 (T125). The T125 protein (Y52137) has two epidermal growth factor (EGF)-like domains at amino acids 107-134 and 141-176 and is predicted to have a molecular weight of approximately 30kD. T125 is predicted to have no transmembrane domains and appears to be a secreted protein. The sequences of all variants of T125 are used in the invention to create antibodies which selectively bind to T125. The T125 polypeptide is used
                                                                                                                                                         Novel polynucleotides cellular processes -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to modulate a variety of cellular processes. It can be used to produce fusion proteins. The protein may also be used to produce antibodies, and identify 7125 antagonists and agonists. The 7125 polynuclectides, predictive medicine; and methods of treatment of 7125 associated disorders. The 7125 polynuclectides can be used in screening assays; to detect 7125 mRNA; to detect genetic alterations in the 7125 gene; in forensic biology; and as a source of primers and probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence

Its EGF-like domains and may CC adult tissues, with high expression in heart, placenta, spleen, CC estis, thyroid, spinal cord and lymph node. Zneul can be used as CC ord, heart, spleen, testis, thyroid, spinal cord and lymph node. Zneul can be used as CC cord, heart, spleen, testis, thyroid and lymph nodes. It may CC concer, to repopulate blood cells after chemotherapy, to stimulate CC glay a role in breast cancer, glioblastomas, and pituitary CC cancer, to repopulate blood cells after chemotherapy, to stimulate CC myofibroblast proliferation, stimulate or inhibit growth factors CC regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), CC Zneul, can be used to raise specific antibodies for use e.g. in CC Including specific domains of Zneul and epitope-bearing portions of CC Zneul, can be used to raise specific antibodies for use e.g. in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC C74446 to C77606 encode the proteins given in B40237 to B43397, which CC represent the human ORFX open reading frames 1 to 3161. The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; mootropic; neuroprotective; osteopathic; CC anticonvulsant; antiparkinsonian; immunosuppressant; immunostimulant; CC cardiant; thrombolytic; coaquiant; vasotropic; antibacterial; CC cardiant; thrombolytic; coaquiant; vasotropic; antibacterial; CC antiviral; antifungal; antirheumatic; antihiproid; and antibacterial; CC antiviral; antifungal; antirheumatic; antihiproid; and antianaemic. The CC sequences can be used for determining the presence of or predisposition CC to, or preventing or treating pathological conditions associated with an CC ORFX-associated disorder. The nucleic acids can be used to express ORFX CC proteins in gene therapy vectors. The proteins and nucleic acids may be CC disorders, osteoarthritis, graft vs host disease, cardiovascular disease, CC diabetes mellitus, hypertension, hypothyroidism, cholesterol ester CC storage, systemic lupus erythematosus, severe combined immunodeficiency CC (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune CC disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and CC cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to chance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes secreted and transmembrane polypeptides and their polypucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          114

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to 234338, and Y41685 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                      1 GGGCVQPG 8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   26-APR-1999 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion 234338, and v41685 to v41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.

                                                                                                      like protein. Its anino acid sequence was deduced from the nucleotide sequence (see v84341) of a cDNA clone isolated from a gene in cDNA library. Zneul's closest human homologue is HSMHC3WSA, which contains Notch 4. Zneul's closest human homologue is NSMHC3WSA, which contains Notch 4. Zneul is also homologues to Notch 4 in its CE closest human is contained in a cosmid CE CENTLIKE domains and may be involved in EGF receptor pathways. The placenta spleen, testis, thyroid, spinal cord and lymph ce conders and lymph ce conders and lymph nodes. It may also play a role in breast concer, CC differentiation factor in the spinal cord, heart, spleen, testis, clyroid, spinal cord and lymph ce can be used as a growth, maintenance, or concer, and pituitary adenomas. Zneul may be used to treat CC chemotherapy, to stimulate myofibroblast proliferation, stimulate CC contraception, or to regenerate nerves. Claimed Zneul and CC contraception, or to regenerate nerves. Claimed Zneul
                                                                                                  Sequence
                                                                                                              contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in diagnostic assays.
                                                                                                                                                                                                                                                                                                                                                                                                         This polypeptide comprises human Zneul, a new neuro-growth factor-
like protein. Its amino acid sequence was deduced from the
